DynaOps Installation and Permissions Guide

This guide explains, step by step, how to install the **DynaOps** app on an Android phone from an APK file, and how to grant the permissions the app requests so that location (GPS), the camera and notifications work correctly.

> **Important:** The app will not open its main screen until all required permissions are granted. If you deny a permission, the app will keep asking for it and direct you to Settings until you enable it.

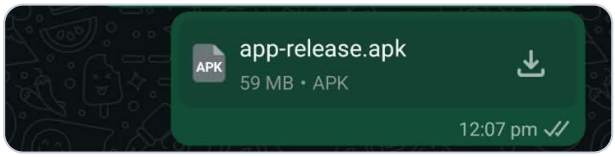

Before You Start

- A phone running **Android** (the app is not currently available for iPhone).
- An internet connection.
- The app file **DynaOps.apk** (sent to you by the company via WhatsApp, email or a download link).
- Your sign-in details (username and password) from your administrator.

Part 1: Installing the App

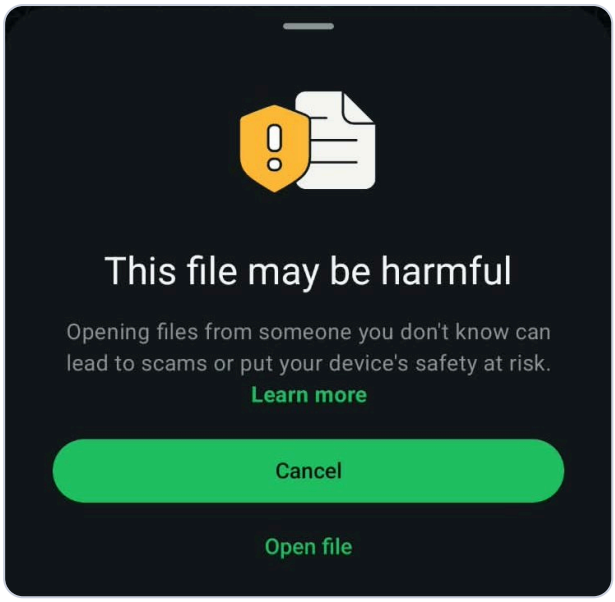

1. Open the APK file

Open the chat or message containing the app file, then tap the file to download and open it.

2. Get past the file warning

WhatsApp (or your browser) may warn that the file could be harmful. This is normal for any app that is not downloaded from the Google Play Store. Tap **Open file**.

> If you downloaded the file in a browser and see **"This file may be harmful"**, tap **Download anyway**.

3. Allow installing apps from unknown sources

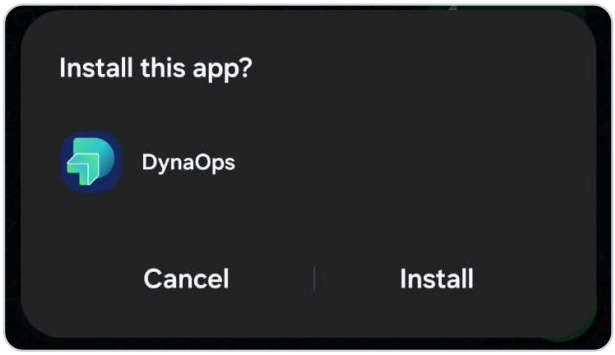

The first time you install, Android may tell you that installing from this source is not allowed. If so:

1. Tap **Settings** in the message that appears.
2. Turn on **Allow from this source**.
3. Press Back, and the installation screen will appear.

> If you do not see this message, skip this step.

4. Install the app

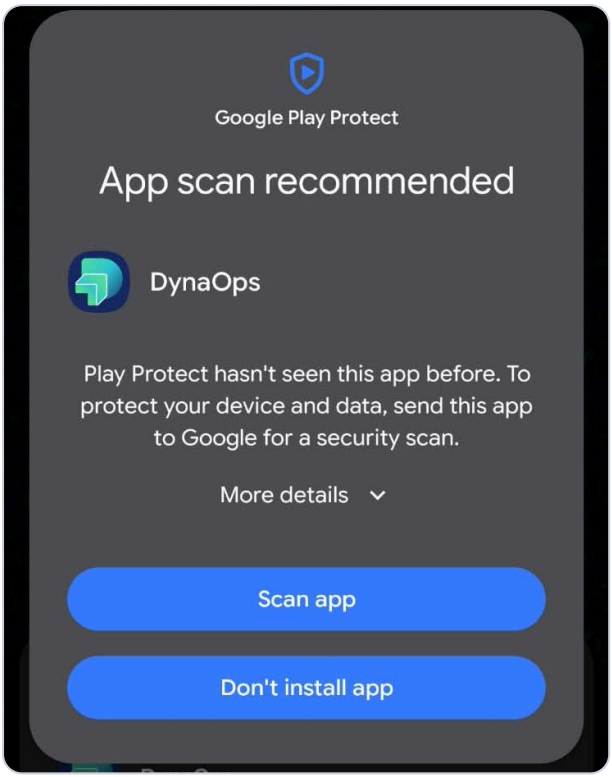

Tap **Install**.

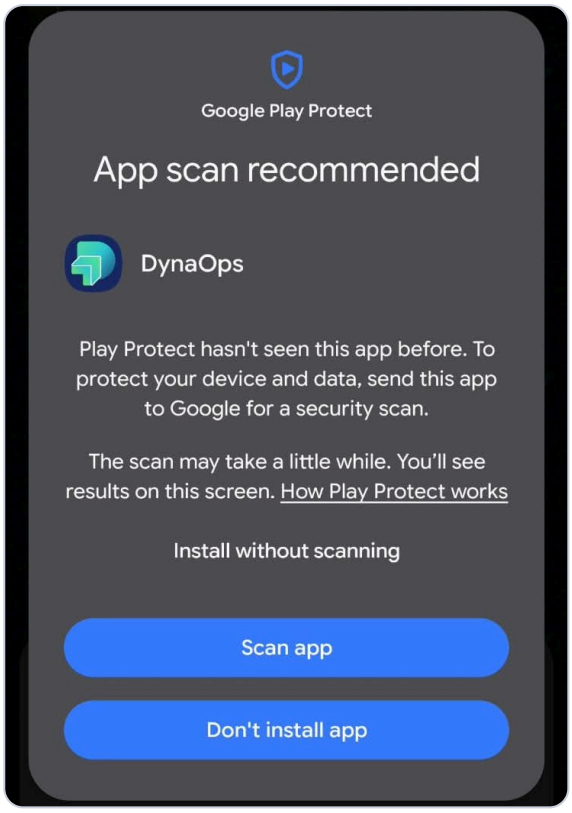

5. Get past the Google Play Protect warning

Google Play Protect may show a message saying it has not scanned this app before:

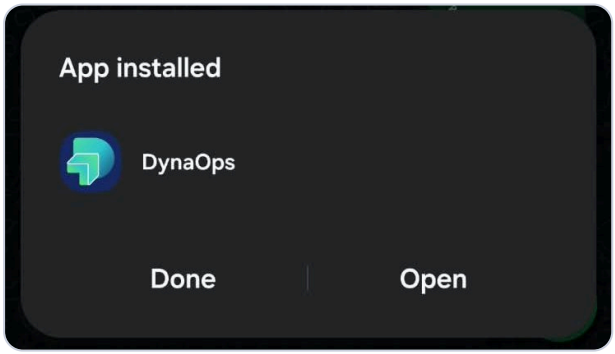

1. Tap **More details**.
2. Tap **Install without scanning**.

6. Open the app

When installation finishes, tap **Open**. You will also find the **DynaOps** icon among your phone's apps.

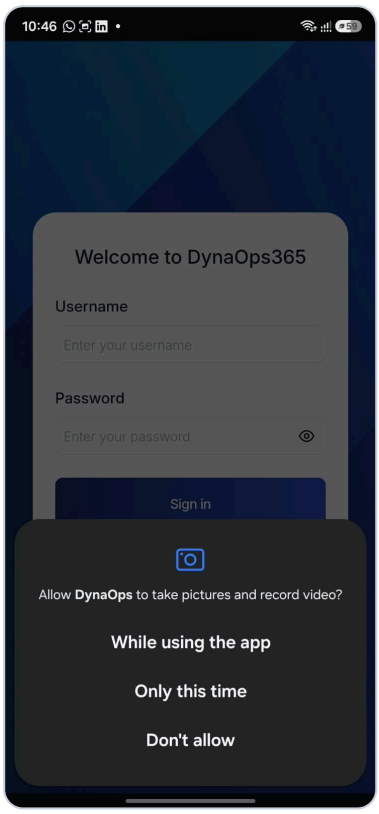

> If you already have an older version of the app, the new installation updates it automatically; there is no need to uninstall it first.

Part 2: First Launch and Sign-in

Camera permission

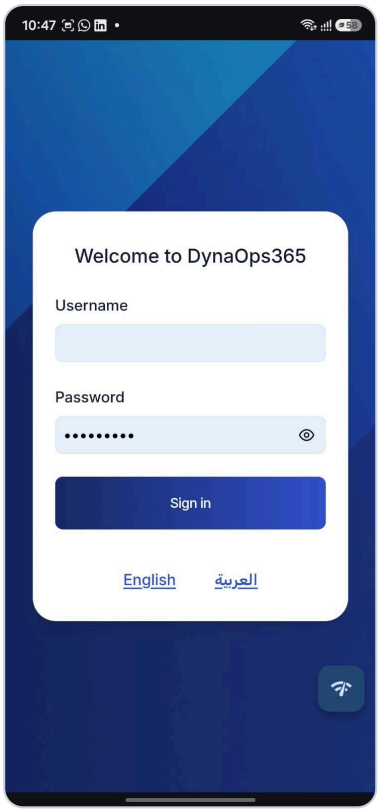

The first time you open the app, a message asks for **camera** permission. Choose **While using the app**.

> **Why:** So you can take photos and upload them directly from inside the app (such as visit photos or documents).
> This message appears **only once**. If you deny it, you will only be able to upload photos from your gallery. See "Troubleshooting" below to enable it later.

Sign in

Enter the **username** and **password** you received from your administrator, then tap **Sign in**. You can switch the app's language using the **English** and **العربية** links below the form.

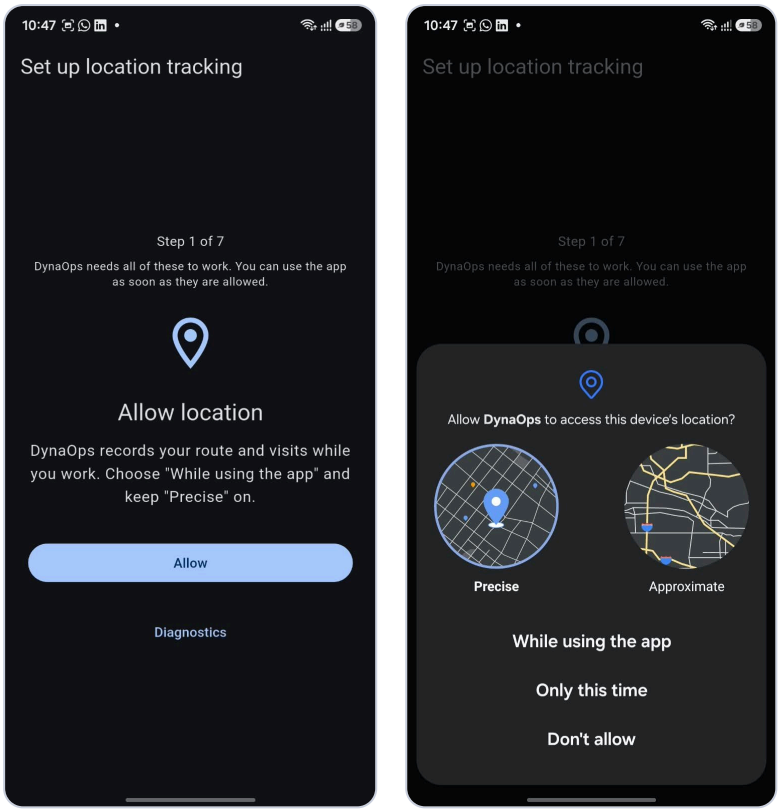

Part 3: Granting Tracking Permissions

After signing in, the **Set up location tracking** screen appears, with numbered steps (for example, "Step 1 of 7"). Follow them in order.

> The app may skip some steps automatically if they are already satisfied (for example, Step 2 if you chose precise location, or Step 4 if location is already on), so you may go straight from Step 1 to Step 3, for example.

Step 1: Allow location

1. Tap **Allow**.
2. In the message Android shows:
   - Make sure **Precise** is selected, not "Approximate".
   - Choose **While using the app**.

> **Why:** The app records your route and visits while you work.

Step 2: Turn on precise location

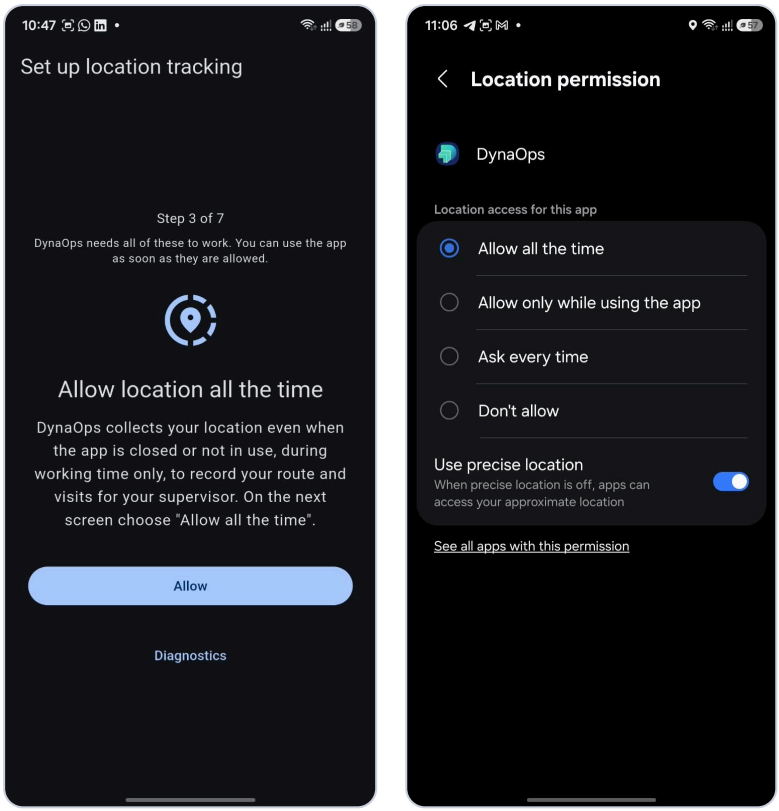

This step only appears if you chose "Approximate" location by mistake.

1. Tap **Open settings**.
2. Go to **Permissions** → **Location**.
3. Turn on **Use precise location**.
4. Return to the app; it continues automatically.

> Approximate location can be kilometres away from where you actually are, so a route cannot be recorded with it.

Step 3: Allow location all the time

1. Tap **Allow**; the location permission screen opens in Settings.
2. Choose **Allow all the time**, and make sure **Use precise location** stays on.
3. Press Back to return to the app.

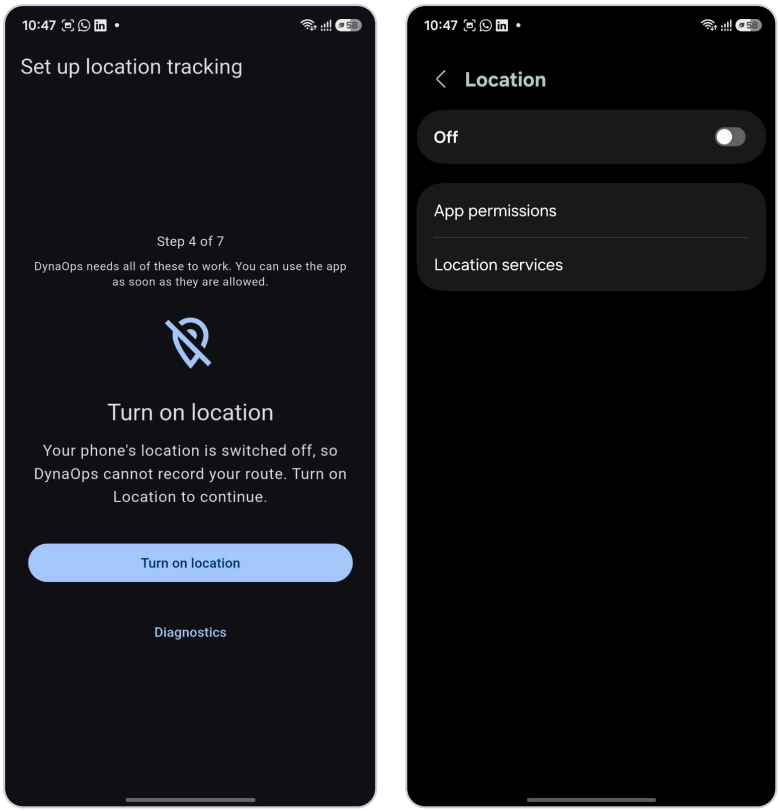

> **Why:** So the app can record your location even when it is closed or the phone is locked, **during working time only**.

Step 4: Turn on location (GPS)

This step appears if location is switched off on the phone.

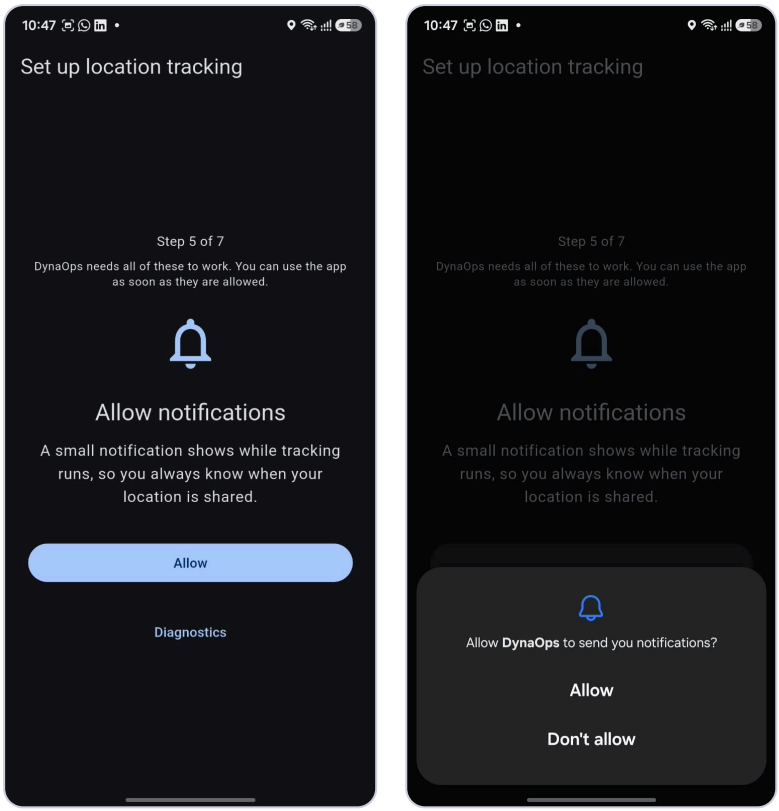

1. Tap **Turn on location**; the Location screen opens in Settings.
2. Turn on the switch at the top so it shows **On**.
3. Return to the app; it continues automatically.

> **Important:** Keep location on throughout working time. You can also turn it on by swiping down from the top of the screen and tapping the **Location** icon.

Step 5: Allow notifications

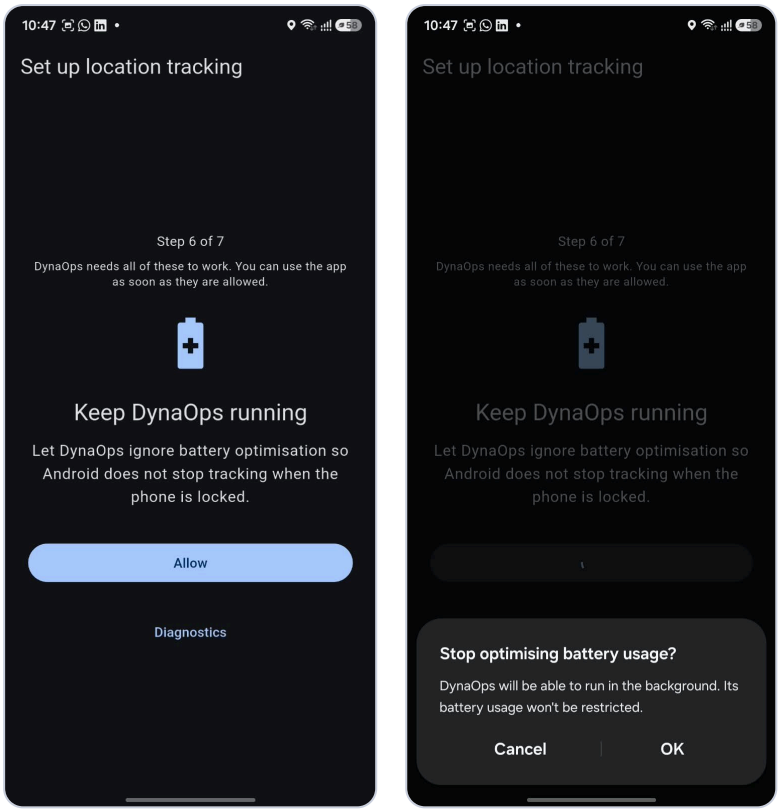

1. Tap **Allow**.
2. In Android's message, choose **Allow**.

> **Why:** A small persistent notification shows while tracking runs, so you always know when your location is shared. **Do not turn this notification off.**

Step 6: Keep DynaOps running (battery optimisation)

1. Tap **Allow**.
2. In the **Stop optimising battery usage?** message, tap **OK**.

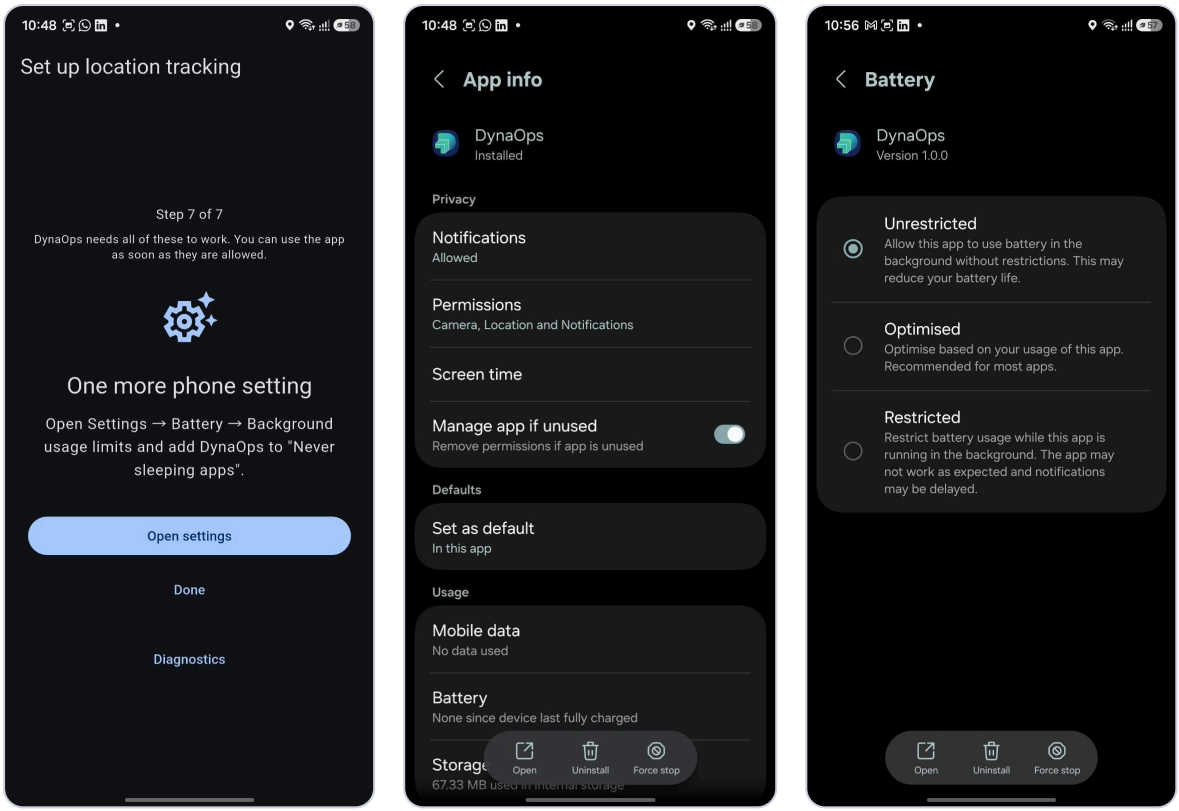

> **Why:** Without this step, Android may stop the app when the phone is locked, and route recording will be interrupted.

Step 7: Extra setting for your phone brand

This step appears on some phone brands that aggressively close apps running in the background. The app shows the instructions for your phone.

Example on a Samsung phone:

1. Tap **Open settings**; the **App info** page opens.
2. Tap **Battery**.
3. Choose **Unrestricted**.
4. Return to the app and tap **Done**.

On Samsung phones it is also recommended to open **Settings → Battery → Background usage limits** and add DynaOps to **Never sleeping apps**.

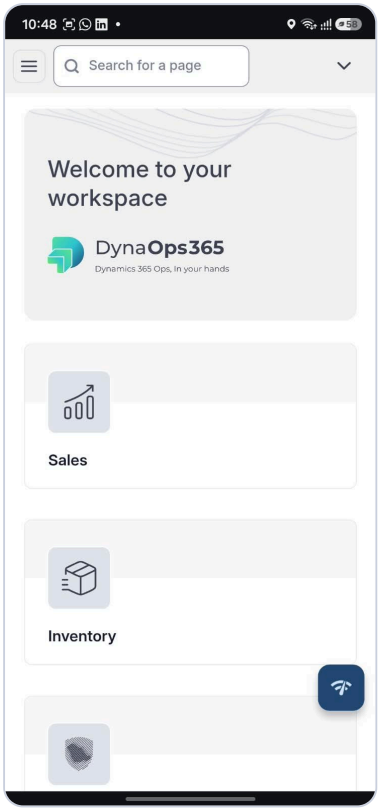

Other phone brands:

Phone brand	Required setting
Samsung	Settings → Battery → Background usage limits → add DynaOps to **Never sleeping apps**
Xiaomi / Redmi / POCO	Open the app's settings → turn on **Autostart** → set **Battery saver** to **No restrictions**
Huawei / Honor	Settings → Battery → App launch → choose DynaOps → **Manage manually** and turn on **all three switches**
OPPO / Realme / OnePlus	Open the app's settings → Battery → allow **Background activity** and **Auto launch**
Vivo / iQOO	Settings → Battery → Background power consumption → allow DynaOps **to run in the background**

> Names may differ slightly between system versions, but the goal is the same: **stop the phone from closing DynaOps in the background.**

All Done

After completing all the steps, the app opens the main workspace and you can start working.

Permissions Summary

Permission	Correct choice	Required?	Purpose
Camera	While using the app	Optional	Taking photos inside the app
Location	While using the app + **Precise**	✅ Yes	Recording route and visits
Location all the time	**Allow all the time**	✅ Yes	Tracking while the app is closed
Location service (GPS)	On	✅ Yes	No location without it
Notifications	Allow	✅ Yes	Tracking notification
Ignore battery optimisation	OK	✅ Yes	Stops Android from killing the app
Phone-brand setting	Depends on the phone	Strongly recommended	Stops the app being closed in the background

---

Troubleshooting

The "Allow" button does nothing, or takes me straight to Settings

This means you denied the permission more than once before, and Android will not ask again. Tap **Open settings** and enable the permission manually under:
Permissions → **(Location / Notifications)**, then return to the app.

I want to enable the camera after denying it

1. Long-press the **DynaOps** icon → **App info** (or: Settings → Apps → DynaOps).
2. **Permissions** → **Camera** → **Allow only while using the app**.

The route breaks or tracking stops when the phone is locked

Check that:

- Location permission is set to **Allow all the time** and **Precise**.
- Location (GPS) is on.
- Battery optimisation is ignored for the app (Step 6).
- Your phone brand's setting is done (Step 7).
- **Power saving mode** is off during work.
- You do not **Force stop** the app or keep swiping it away from the recent apps list.

The notification "Location permission needed — tap to open DynaOps" appeared

The location permission was removed (Android can remove it automatically if the app is not used for a while, through the **Manage app if unused** option on the App info page). Tap the notification and the app will take you to the missing step. To prevent this from happening again, turn that option off on the App info page.

The notification "Location tracking is paused" or "Outside your shift" appeared

This is normal and not a problem: tracking only runs **during your shift**, and resumes automatically when it starts.

The app will not install, or "App not installed" appears

- Make sure the phone has enough free storage.
- If you have an older version from a different source, uninstall it first, then install the new one.
- Make sure the file downloaded completely (download it again if in doubt).

Privacy

- The app collects your location **during working time only**.
- The persistent notification is **always** shown while your location is being shared, so you always know when tracking is running.
- The data is sent only to your supervisor at the company, to follow your route and visits.
